

Supplementary Figure S1. Study flowchart for the comparison of ART outcomes in premature ovarian failure and age-matched control women

Supplementary Figure S2. Distribution of clinical outcomes between the Premature Ovarian Failure (POF) group (n = 249) and the Control group (n = 279). The graph illustrates the differences in rates for biochemical pregnancy, clinical pregnancy, live birth, miscarriage, and pregnancy not achieved. There was a statistically significant difference in live birth rate ($p < 0.001$), and the miscarriage rate—calculated per clinical pregnancy—was higher in the POF group (35.7% vs. 19.2%, $p = 0.047$)
